

Supplementary Figure S2

Individual actograms and Lomb-Scargle periodograms

Every spider recorded in this study is shown once per lighting condition.

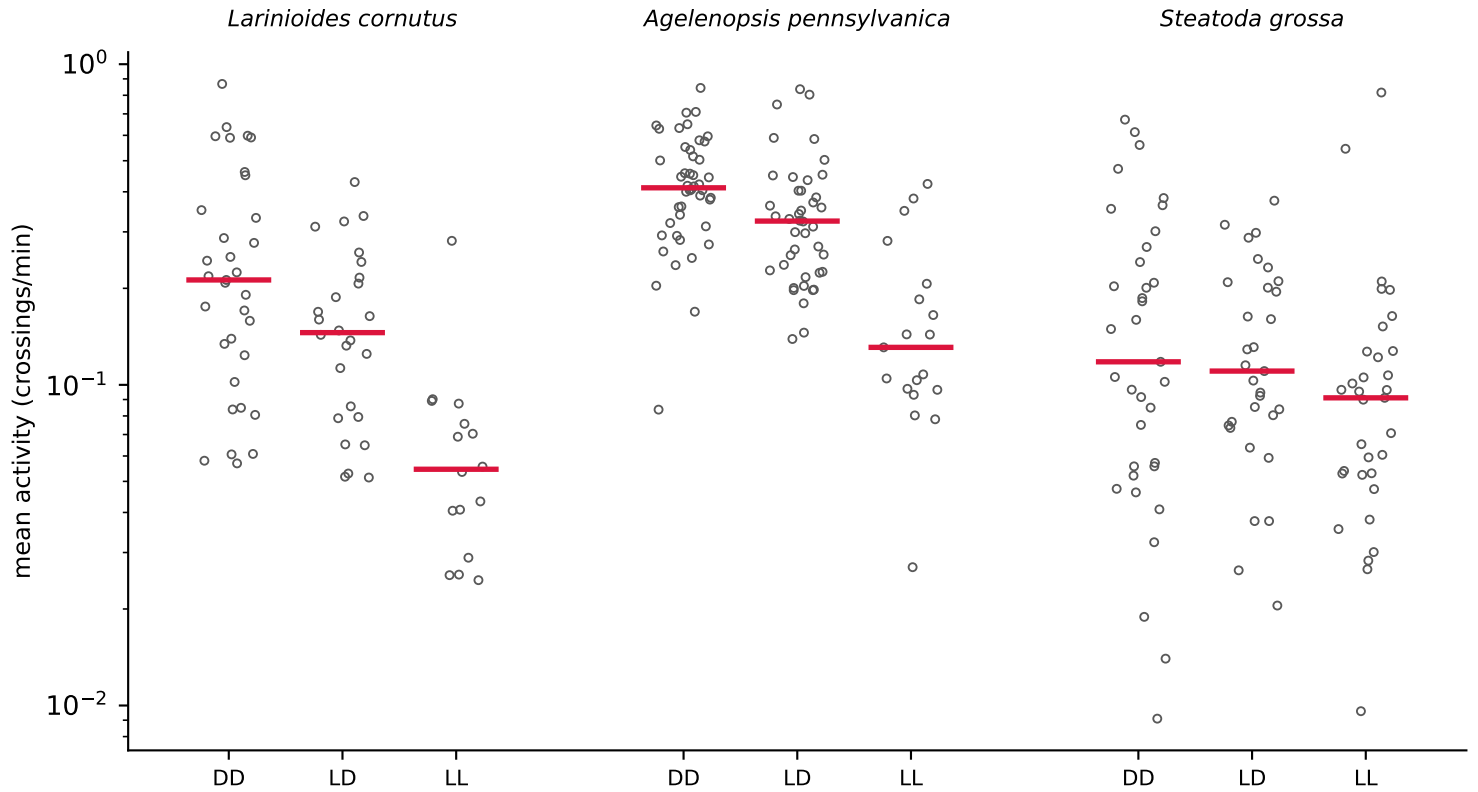

Left: double-plotted actogram of raw locomotor activity, 6-min bins. Bar height is proportional to beam crossings and uses the SAME scale in every panel (full row height = 6 crossings per 6-min bin), so amplitudes may be compared directly between individuals, species and conditions. Grey shading marks darkness.

LD panels are plotted on Zeitgeber Time (ZT0 = lights-on). DD and LL panels are plotted on Circadian Time (CT0 = projected lights-on of the last light-dark cycle experienced).

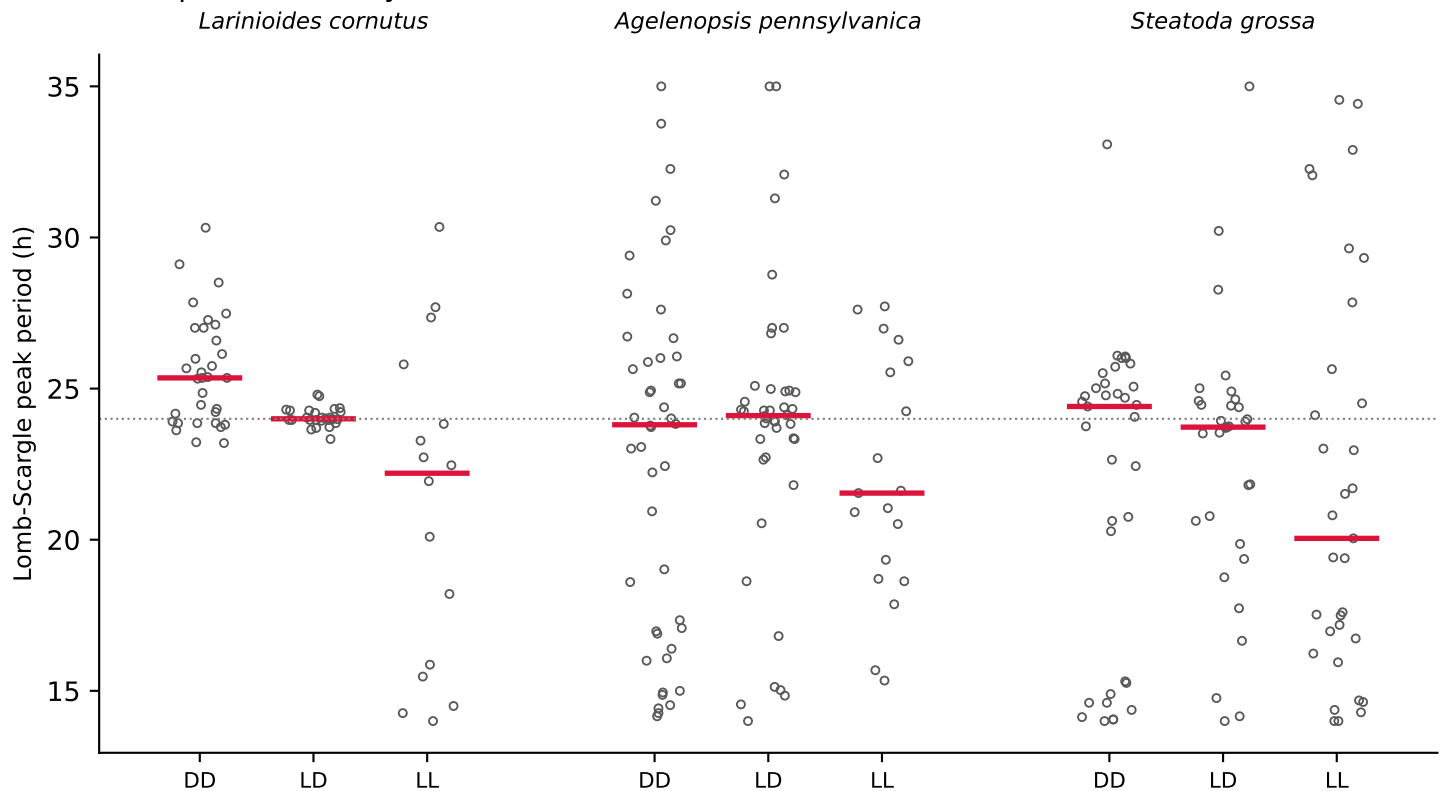

Right: Lomb-Scargle periodogram over 14-35 h. Red dashed line is the $p = 0.05$ false-alarm level; the peak period and its p value are printed in each panel.

Recordings with 3 or more whole days of zero beam crossings were excluded, in every lighting condition. 41 of 322 recordings were removed on this criterion; they are listed in Supplementary Table S2.

Activity level of every individual

Peak period of every individual

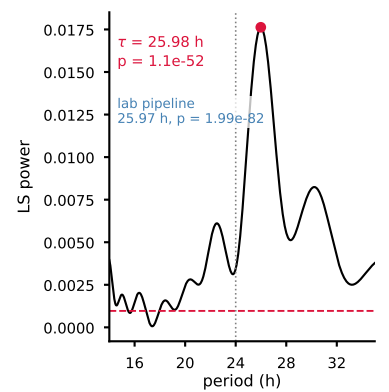

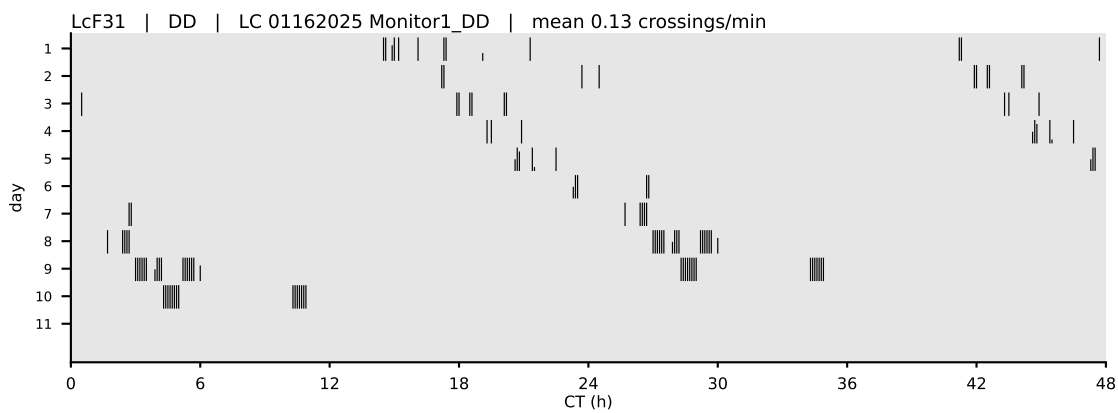

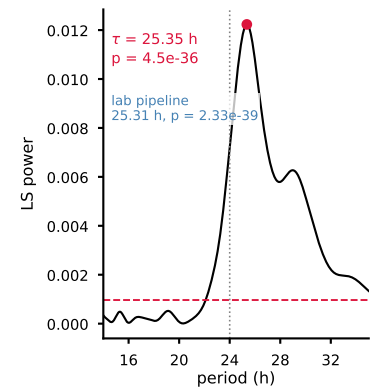

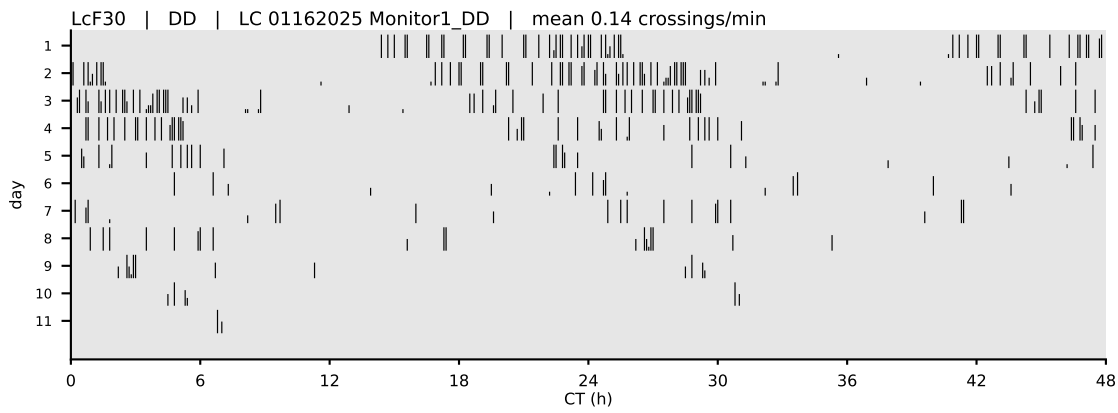

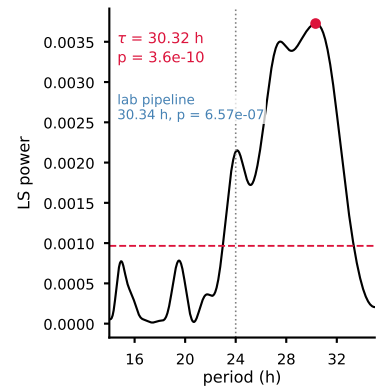

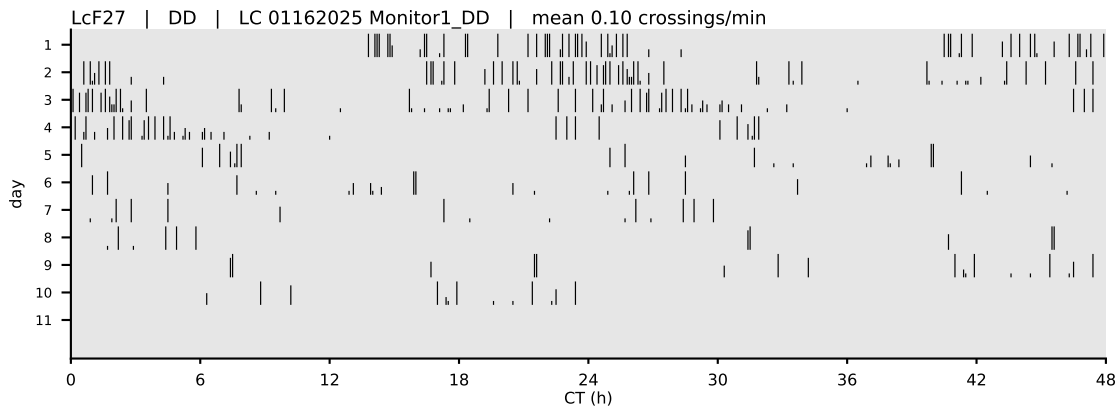

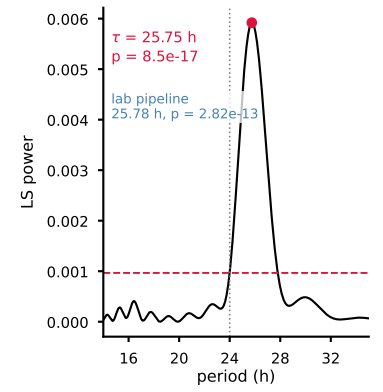

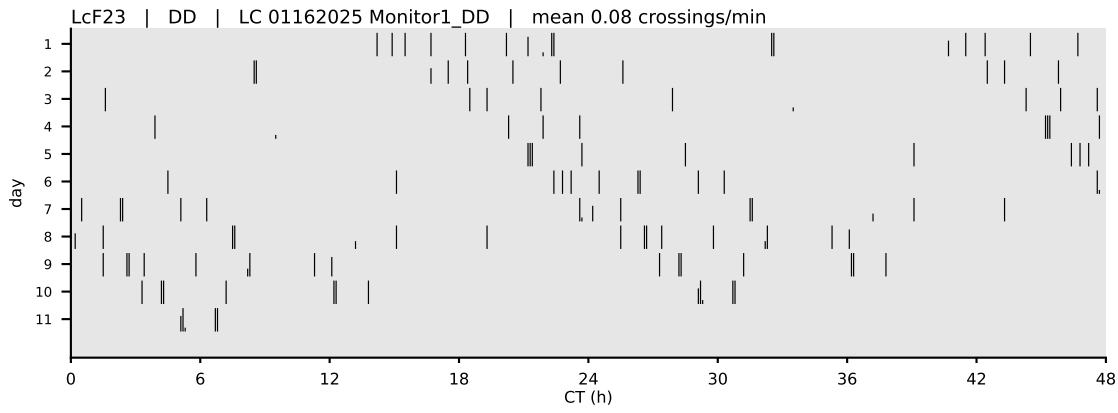

Each circle is one individual recording; red bars are medians. Top panel is on a log scale. These distributions show how representative any single actogram is of its species.
